

RACQUET STRAND CLIP

Abstract of the Disclosure

A racquet strand clip for fastening a strand to a surface and a method for using the same, comprising a generally rectangular block with a narrow slot cut lengthwise through the block. The slot is cut through the block from top to bottom, and from one end of the block to a point approaching the other end of the block, thus creating an open end and a closed end. In operation, a user threads one end of a strand through a hole in a surface, then pulls the strand taut and slides the end of the strand through the slot within the clip. Upon releasing the end of the strand, the natural elasticity of the strand combined with the narrowness of the slot creates the contact pressure needed to keep the strand from slipping out of the slot, and to keep the clip pressed firmly in place against the surface.
